

MCQMaker

Version 4.0.1

Installation

To install the program on your computer, two options are possible:

- If you are using *Windows*, you can download the executable version in the form of a *zip* file at [the following address](#). Once the download is complete, unzip the file to the desired location.
- If you are using another OS or want to modify your version of MCQMaker, you can clone the git repository using the following command in a terminal once in the folder of your choice.

```
git clone git@gitlab.com:PaulCreusy/qcmaker.git
```

Creation of a virtual environnement

If you choose to clone this repository, you might want to use a virtual environnement.

You can create one with the following command :

```
python -m virtualenv mcqmaker_venv
```

To start it, use the command on Windows :

```
mcqmaker_venv\Scripts\Activate.ps1
```

Or for MacOS and Linux :

```
mcqmaker_venv\Scripts\activate
```

Installation of the necessary packages

To use this software, you need several Python libraries specified in the `requirements.txt` file.

To install them, use the command :

```
pip install -r requirements.txt
```

Usage

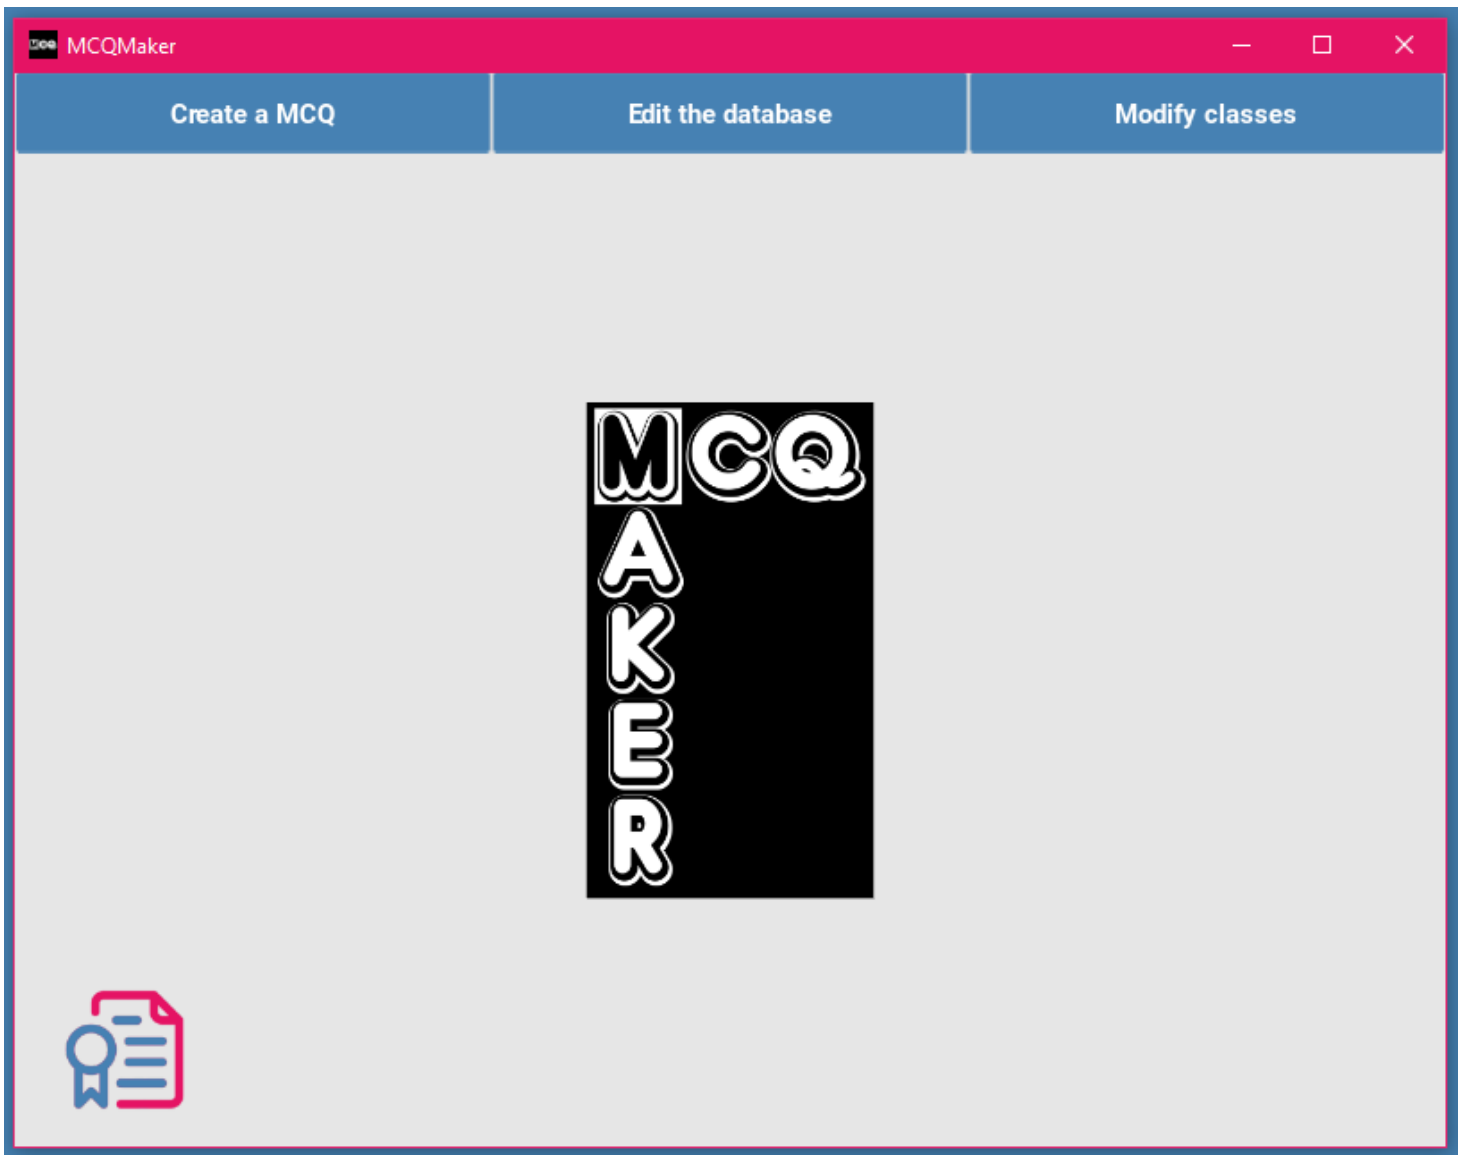

If you have downloaded the executable version, simply double-click on the file `MCQMaker.exe` .

If you have cloned the git repository, the program launches with the following command in the program folder:

```
python MCQMaker.py
```

MCQMaker is composed of four main menus whose functions are explained below:

- A general menu launching at the start of the application
- A menu for generating MCQs
- A menu for creating and editing databases
- A menu for modifying classes

Menu for generating MCQs

This menu allows you to generate MCQs in several different formats, `txt` , `docx` , `h5p` , and `xml` , from configurations created in this menu.

MCQMaker

Folder 1File 12 /3

Folder 1File 21 /1

Folder 1File 31 /1

Folder 2File 42 /3

Folder 2File 12 /2

Creating a configuration

To create a configuration, you must select a file from the database using the menu in the top right corner. Once you have selected the desired folder and file, you can enter the number of questions from this file that you want in the MCQ. The number of available questions in the file is indicated to the right of the text area. Then, you must add the database by clicking on the + button. This new file will be displayed in the drop-down list just below, and you will be able to modify the number of questions of the already chosen files later.

Number of questions

The total number of questions contained in the configuration is displayed on the left-hand menu.

Before saving it, you must specify its name in the corresponding text area. After saving it, you will be able to load it later using the `Load a configuration` button.

Selecting a class

If you choose to use a class, it is possible that the total number of questions available in some files, which would have already been used by this class in a previous MCQ generation, is different from the value contained in the configuration. In case of exceeding the number of available questions, the number of selected questions will be automatically adjusted to the maximum.

Generating an MCQ

The MCQ generation is launched from the `Generate the MCQ` button once a configuration has been selected or entered in the interface.

Selecting a configuration

To select a configuration, click on the `Load a configuration` button where you will be able to create a new one or load an existing one. The name of the selected configuration will be used as the name of the MCQ.

Creating a new configuration

It is not necessary to use this button to create a new configuration. You can simply select files and enter a configuration name.

Selecting a class

You have the option to select a class before generating the MCQ. This will limit the questions selected during the MCQ generation by not taking those that have already been used by this class. Additionally, if you wish, the questions that will be used for this MCQ generation can be saved in the class so that they are not used again in a subsequent MCQ.

Template selection

In order to allow the generation in `docx`, select the Word template you want to use. A default template has been provided, but you can modify it, especially its style, as long as the following conventions are maintained:

- to display the title of the MCQ, if you want to specify it, use the syntax `{NAME_MCQ}` .
- to display the list of questions, the indicators `### LIST_QUESTIONS_START ###` , to indicate the start of this list, and `### LIST_QUESTIONS_END ###` , to indicate its end, must be present.
- for each question, the following conventions are used:
 - `{ID_QUESTION}` to display the number of the question
 - `{QUESTION}` to display the question
 - `{LIST_OPTIONS}` to display all the options in column

Additional options

You also have the option to customize the created MCQ using the three checkboxes:

- `Shuffle by parts` allows you to shuffle the questions within a single file of the database.
- `Shuffle all questions` allows you to shuffle all the questions of the MCQ, whether within a single file of the database or between these files.
- `Store data in class` allows you to save in the selected class the questions selected for this generation, which avoids duplicates for the next MCQ.

MCQ Generation

By clicking on the `Generate` button, the window below appears, where you can choose the export formats of the generated MCQs, among `txt` , `docx` , `h5p` , and `xml` .

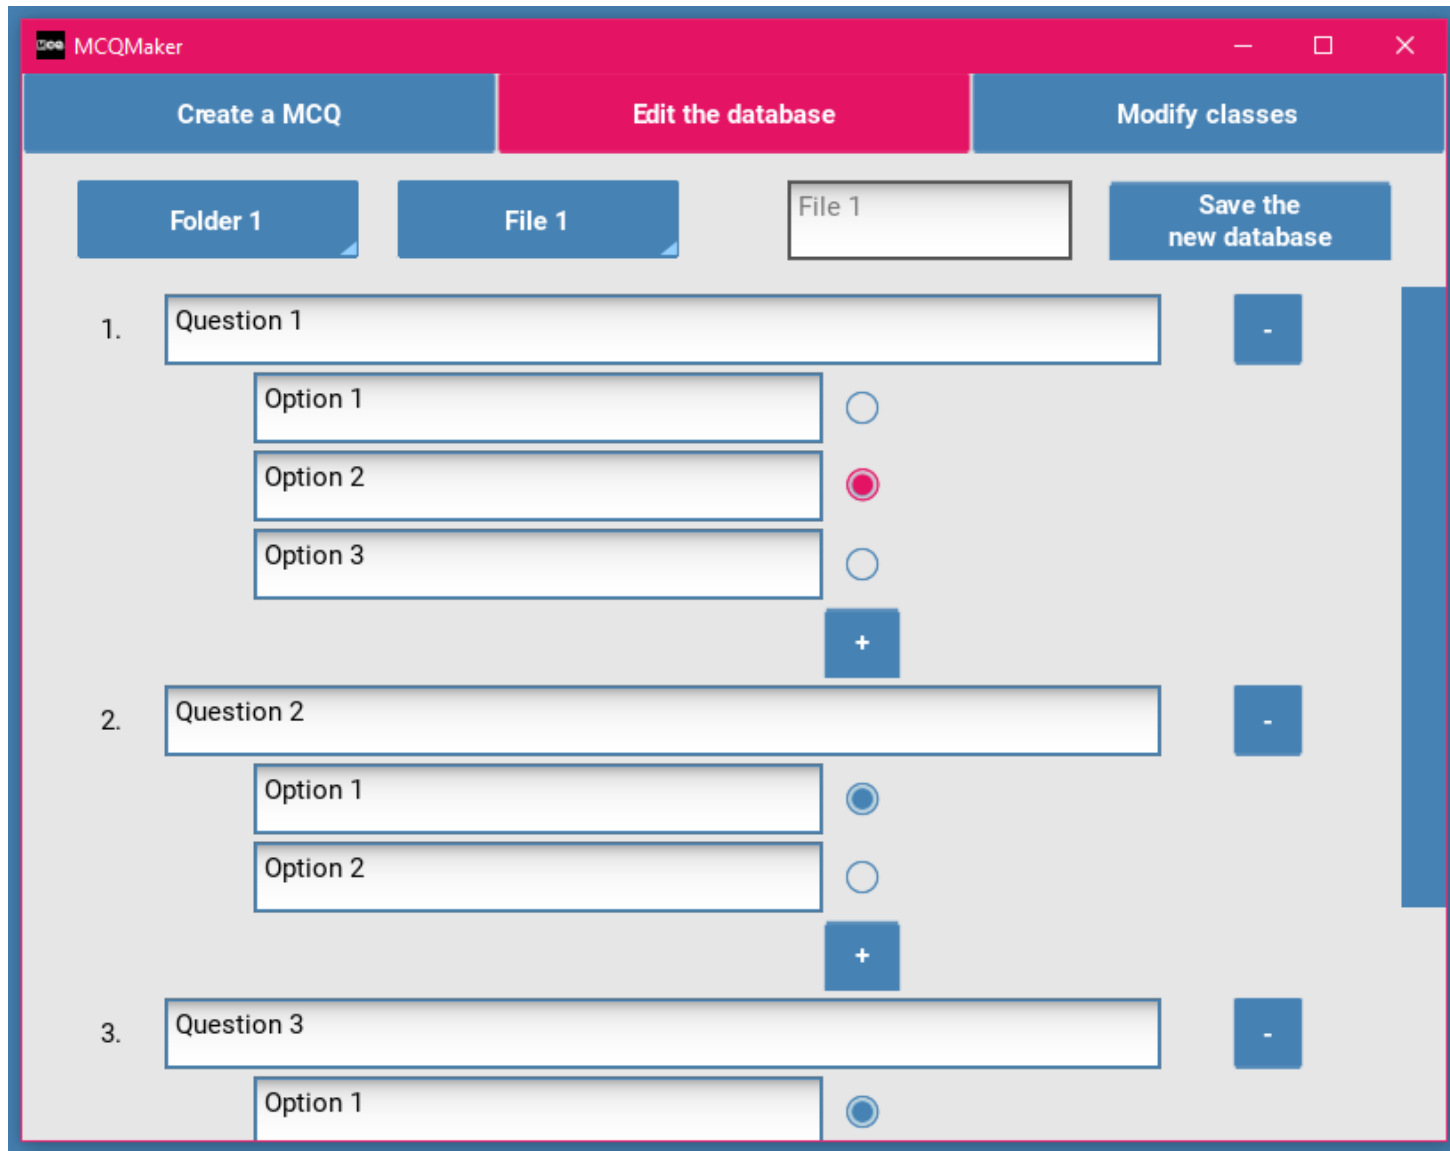

The generated MCQ, in its various formats, is saved in the `Export` folder: a folder containing all the desired formats will have been created, with the name of the configuration appended to the name of the selected class.

Export to docx format

Export to docx format is only possible if you have selected a template from the corresponding drop-down list.

Database editing menu

This menu allows you to create new files in the database and edit existing files.

The screenshot shows the 'Edit the database' menu in the MCQMaker application. The menu has three tabs: 'Create a MCQ', 'Edit the database' (active), and 'Modify classes'. Below the tabs, there are three buttons: 'Folder 1', 'File 1', and 'File 1'. To the right of these buttons is a text field containing 'File 1' and a 'Save the new database' button. The main area of the menu displays a list of questions. Each question has a number, a text field for the question, and a list of options with radio buttons. Question 1 has three options, with Option 2 selected. Question 2 has two options, with Option 1 selected. Question 3 has one option, with Option 1 selected. Each question entry has a minus button to its right and a plus button below the options.

Question	Options	Selected
1. Question 1	Option 1, Option 2, Option 3	Option 2
2. Question 2	Option 1, Option 2	Option 1
3. Question 3	Option 1	Option 1

Creating a folder

You can create a folder in the database from this menu, by selecting **New** on the first drop-down list; you can then enter the name of this new folder in the corresponding text field, and then click on the creation button.

Creating a file

You can create a file in a folder of the database from this menu; for this, you can select the name of the desired folder, then select **New** . You can then specify the name of this new file, which should not be a name already taken by a file in this same folder, then save it before or after inserting some questions in the database from the bottom menu. This functionality is detailed just below.

Editing a file

You can edit a file, whether new or previously saved, using the lower part of the screen. Each question is displayed in this part, assigned a number, and the possible answer choices are displayed below, each associated with a checkbox indicating that it is the correct answer. You can add an option by clicking on the **+** button at the end of the existing options list.

You can also delete a question by clicking on the **-** button at the end of each question.

You can finally add a question by clicking on the **+** button at the bottom of the screen.

Question number

The question number is arbitrary, it simply serves as a reference in the file, especially when saving questions if errors are detected, but it is not important for the generation of the MCQ.

Translation:

Option Deletion

An option can be deleted by simply erasing its content in the text box; saving will not take it into account.

Easy Navigation

To facilitate file editing in this menu, you can navigate between text boxes, checkboxes, and buttons by pressing **TAB** . The selected zone will be displayed in pink to allow you to orient yourself. In addition, once on a checkbox or button, you can press **ENTER** to respectively check or uncheck the box or trigger the function associated with the button.

Question Deletion

PUT THE WARNING HERE FOR GENERATION WITH CLASSES AND RETAIN PREVIOUS NUMBERS

Error Detection

When saving a file, several checks are performed on the content you have entered:

- first, a question where nothing has been entered in the text box entitled `question` will not be taken into account and therefore not saved, even if information is contained in the option fields.
- then, an error message will appear if no correct answer has been selected, interrupting the saving of the entire database. The user will have to select a correct answer in the question considered and then save the file again.
- finally, an empty option will not be considered and therefore not saved. If this was the only correct answer to the question, the same error message as before will be displayed.

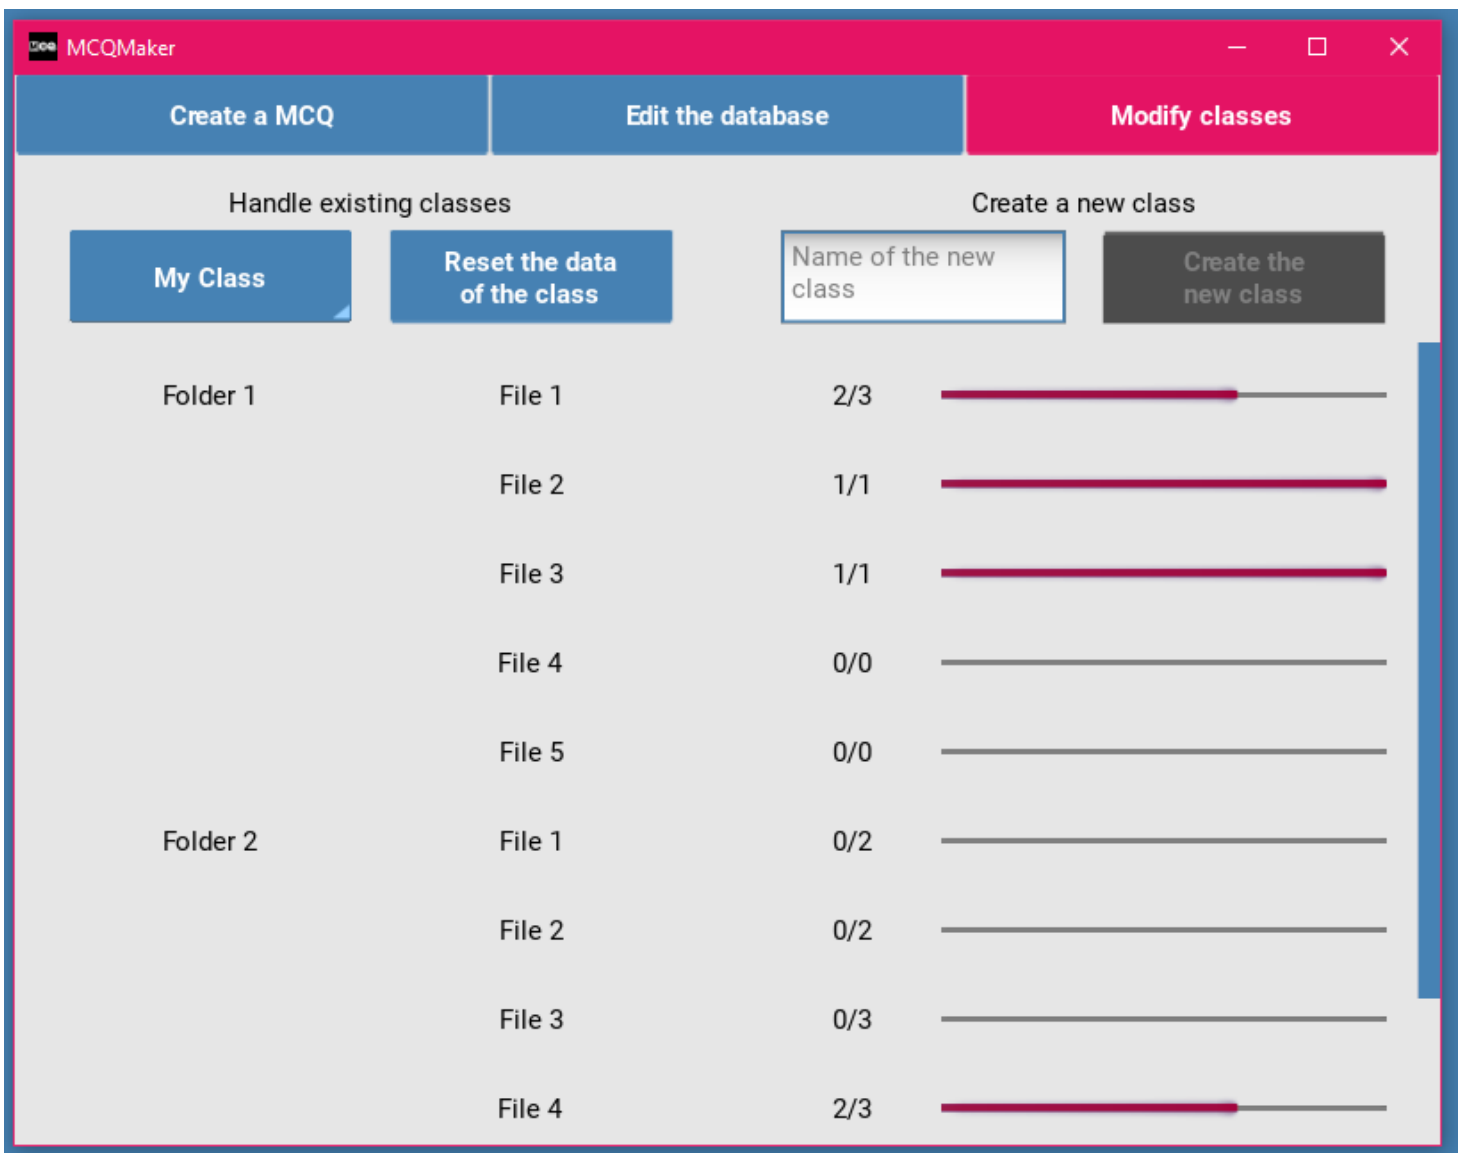

Saving the file being edited

If you change the file or folder without having previously saved the file you were editing, its modifications will be lost.

Class Modification Menu

This menu allows you to manage the classes that will be used in the multiple choice question generation menu.

Existing Classes

The upper-left part of the menu allows you to select an existing class. The contents of the selected class will be displayed in the lower part of the window. For each file in the database, the ratio of the number of questions used to the total number of questions will be indicated next to it. You can reset the data for this class by clicking on the dedicated button: this means that all the questions from all the files in the database will be accessible to the class again.

Resetting Data

Resetting the data for a class is an irreversible action.

Creating a Class

The right-hand side of this menu allows you to create a new class after specifying its name in the corresponding text box. You cannot create a class with the same name as an existing class.

First Use

For first-time use, it is recommended that you first create a database from the second menu. For more information on this, please refer to [this section](#).

If you want to use the class concept (which allows you to memorize questions already used for generating a multiple-choice quiz to avoid redundancies between different quizzes), you can go to the third menu. You can create your class using the right-hand side of the menu, as explained in [this section](#).

You can then proceed to generate the multiple-choice quiz by going to the first menu, the use of which is explained in [this section](#).

Credits

This software was developed by Paul Creusy, for the backend part, and Agathe Plu for the frontend part.

The authors thank their families for requesting this project and testing it.
